Introduction

RD Identification

$$\underbrace{Z_i}_{\text{running variable}}$$

RD Identification

$$\underbrace{Z_i}_{\text{running variable}}$$

$$\underbrace{W_i}_{\text{treatment}}$$

RD Identification

$$\underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i=\mathbf{1}(\{Z_i \geq c\})} \underbrace{W_i}_{\text{treatment}}$$

RD Identification

$$\underbrace{Z_i}_{\text{running variable}} \xrightarrow{\quad W_i = \mathbf{1}(\{Z_i \geq c\}) \quad} \underbrace{W_i}_{\text{treatment}}$$

RD Identification

$$\underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i = \mathbf{1}(\{Z_i \geq c\})} \underbrace{W_i}_{\text{treatment}} \Rightarrow \underbrace{Y_i}_{\text{outcome}}$$
RD Identification

$$\underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i = \mathbf{1}(\{Z_i \geq c\})} \underbrace{W_i}_{\text{treatment}} \Rightarrow \underbrace{Y_i}_{\text{outcome}}$$

test scores   admission   outcomes

RD Identification

$$\underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i = \mathbf{1}(\{Z_i \geq c\})} \underbrace{W_i}_{\text{treatment}} \Rightarrow \underbrace{Y_i}_{\text{outcome}}$$
test scores	admission	outcomes
test results	medication	outcomes

RD Identification: Continuity Argument

For potential outcomes $\{Y_i(0), Y_i(1)\}$: $Y_i = Y_i(W_i)$, a weighted **causal effect** can be identified as

$$\tau_c = \mathbb{E}\left[Y_i(1) - Y_i(0) \mid Z_i = c\right]$$

RD Identification: Continuity Argument

For potential outcomes $\{Y_i(0), Y_i(1)\}$: $Y_i = Y_i(W_i)$, a weighted **causal effect** can be identified as

$$\tau_c = \mathbb{E}\left[Y_i(1) - Y_i(0) \mid Z_i = c\right]$$
$$= \lim_{z \downarrow c} \mathbb{E}\left[Y \mid Z = z\right] - \lim_{z \uparrow c} \mathbb{E}\left[Y \mid Z = z\right]$$

RD Identification: Continuity Argument

For potential outcomes $\{Y_i(0), Y_i(1)\}$: $Y_i = Y_i(W_i)$, a weighted **causal effect** can be identified as

$$\tau_c = \mathbb{E}\left[Y_i(1) - Y_i(0) \mid Z_i = c\right]$$
$$= \lim_{z \downarrow c} \mathbb{E}\left[Y \mid Z = z\right] - \lim_{z \uparrow c} \mathbb{E}\left[Y \mid Z = z\right]$$

assuming

- the conditional response functions $\mu_w(z) = \mathbb{E}\left[Y(w) \mid Z = z\right]$ are **continuous**

RD Identification: Continuity Argument

For potential outcomes $\{Y_i(0), Y_i(1)\}$: $Y_i = Y_i(W_i)$, a weighted **causal effect** can be identified as

$$\tau_c = \mathbb{E}\left[Y_i(1) - Y_i(0) \mid Z_i = c\right]$$
$$= \lim_{z \downarrow c} \mathbb{E}\left[Y \mid Z = z\right] - \lim_{z \uparrow c} \mathbb{E}\left[Y \mid Z = z\right]$$

assuming

- the conditional response functions $\mu_w(z) = \mathbb{E}\left[Y(w) \mid Z = z\right]$ are **continuous**
- $\mu_w(z)$ to have a uniformly **bounded 2nd derivative** for CIs (Armstrong and Kolesár, 2018, 2020)

RD Identification: Problems of Continuity Argument

Assumption: **continuous** $\mu_w(z) = \mathbb{E}\left[Y(w) \mid Z = z\right]$

$$\tau_c = \lim_{z \downarrow c} \mathbb{E}\left[Y \mid Z = z\right] - \lim_{z \uparrow c} \mathbb{E}\left[Y \mid Z = z\right]$$

Where does this continuity come from?
RD Identification: Problems of Continuity Argument

Assumption: **continuous** $\mu_w(z) = \mathbb{E}\left[Y(w) \mid Z = z\right]$

$$\tau_c = \lim_{z \downarrow c} \mathbb{E}\left[Y \mid Z = z\right] - \lim_{z \uparrow c} \mathbb{E}\left[Y \mid Z = z\right]$$
Where does this continuity come from?

Lee (2008): **continuous measurement error** in the running variable by units

RD Identification: Measurement Error

$$\underbrace{U_i}_{\text{latent variable}} \qquad \underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i=\mathbf{1}(\{Z_i \geq c\})} \underbrace{W_i}_{\text{treatment}} \quad \Rightarrow \quad \underbrace{Y_i}_{\text{outcome}}$$

	test scores		admission	outcomes
	test results		medication	outcomes

RD Identification: Measurement Error

$$\underbrace{U_i}_{\text{latent variable}} \xrightarrow{Z_i|U_i \sim p(\cdot|U_i)} \underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i = \mathbf{1}(\{Z_i \geq c\})} \underbrace{W_i}_{\text{treatment}} \Rightarrow \underbrace{Y_i}_{\text{outcome}}$$

| ability | test scores | admission | outcomes |
| condition | test results | medication | outcomes |

RD Identification: Measurement Error

$$\underbrace{U_i}_{\text{latent variable}} \xrightarrow{Z_i|U_i\sim p(\cdot|U_i)} \underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i=\mathbf{1}(\{Z_i\geq c\})} \underbrace{W_i}_{\text{treatment}} \Rightarrow \underbrace{Y_i}_{\text{outcome}}$$

ability	test scores	admission	outcomes
condition	test results	medication	outcomes

Why don't we take advantage of the **<u>measurement error</u>** itself for inference?

This Paper

$$\underbrace{U_i}_{\text{latent variable}} \xrightarrow{Z_i|U_i\sim p(\cdot|U_i)} \underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i=\mathbf{1}(\{Z_i\geq c\})} \underbrace{W_i}_{\text{treatment}} \Rightarrow \underbrace{Y_i}_{\text{outcome}}$$
Weighted treatment effects can be estimated if the measurement error in Z_i

This Paper
$$\underbrace{U_i}_{\text{latent variable}} \xrightarrow{Z_i|U_i \sim p(\cdot|U_i)} \underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i = \mathbf{1}(\{Z_i \geq c\})} \underbrace{W_i}_{\text{treatment}} \Rightarrow \underbrace{Y_i}_{\text{outcome}}$$

Weighted treatment effects can be estimated if the measurement error in Z_i

- has a **known distribution**

This Paper
$$\underbrace{U_i}_{\text{latent variable}} \xrightarrow{Z_i|U_i \sim p(\cdot|U_i)} \underbrace{Z_i}_{\text{running variable}} \xrightarrow{W_i = \mathbf{1}(\{Z_i \geq c\})} \underbrace{W_i}_{\text{treatment}} \Rightarrow \underbrace{Y_i}_{\text{outcome}}$$
Weighted treatment effects can be estimated if the measurement error in Z_i

- has a **known distribution**
- is **conditionally (on U_i) independent** of potential outcomes

Key Argument

## Sharp RD Design with A Noisy Running Variable

Sharp RD Design with A Noisy Running Variable
Assumption 1: Sharp RD design

- **I.I.D.** samples $\{Y_i(0), Y_i(1), Z_i\} \in \mathbb{R}^3, i = 1, \cdots, n$
- treatment assignment: $W_i = 1(\{Z_i \geq c\})$, where $c \in \mathbb{R}$ is the **cutoff**
- observation: $\{Y_i, Z_i\}$ where $Y_i = Y_i(W_i)$
Sharp RD Design with A Noisy Running Variable

Assumption 2: Noisy running variable

$$Z_i \mid U_i \sim p\left(\cdot \mid U_i\right)$$

where $p(\cdot \mid \cdot)$ is a **known** conditional density w.r.t. to a measure λ, the latent variable U_i has an **unknown** distribution G

## Sharp RD Design with A Noisy Running Variable

Assumption 2: Noisy running variable

$$Z_i \mid U_i \sim \mathcal{N}(U_i, \nu^2), \nu > 0$$

where $p(\cdot \mid \cdot)$ is a **known** conditional density w.r.t. to a measure λ, the latent variable U_i has an **unknown** distribution G

# Sharp RD Design with A Noisy Running Variable

Assumption 2: Noisy running variable

$$Z_i \mid U_i \sim \text{Binomial}(K, U_i), K \in \mathbb{N}$$

where $p(\cdot \mid \cdot)$ is a **known** conditional density w.r.t. to a measure λ, the latent variable U_i has an **unknown** distribution G

Sharp RD Design with A Noisy Running Variable

Assumption 3: Exogeneity

$$[\{Y_i(0), Y_i(1)\} \perp Z_i] \mid U_i$$

which implies $\mathbb{E}[Y_i \mid U_i, Z_i] = \alpha_{(W_i)}(u)$
Sharp RD Design with A Noisy Running Variable

Assumption 3: Exogeneity

$$[\{Y_i(0), Y_i(1)\} \perp Z_i] \mid U_i$$

which implies $\mathbb{E}[Y_i \mid U_i, Z_i] = \alpha_{(W_i)}(u)$, where $\alpha_{(w)}(u) = \mathbb{E}[Y_i(w) \mid U_i = u]$ is the **response functions** for the potential outcomes conditional on the latent variable u

Sharp RD Design with A Noisy Running Variable
A1 **Sharp** RD

A2 **Noisy** Z_i: $Z_i \mid U_i \sim p\left(\cdot \mid U_i\right)$

A3 **Exogeneity**:
$\overline{\left[\{Y_i\left(0\right), Y_i\left(1\right)\} \perp Z_i\right] \mid U_i}$

Sharp RD Design with A Noisy Running Variable

A2 **Noisy** Z_i: $Z_i \mid U_i \sim p\left(\cdot \mid U_i\right)$

A3 **Exogeneity**:
$\overline{\left[\{Y_i\left(0\right), Y_i\left(1\right)\} \perp Z_i\right] \mid U_i}$

Proposition 1

Let $\gamma_+\left(\cdot\right), \gamma_-\left(\cdot\right)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+\left(Z\right)Y\right] = \mathbb{E}\left[\alpha_{(1)}\left(U\right)h\left(U, \gamma_+\right)\right], \qquad \mathbb{E}\left[\gamma_-\left(Z\right)Y\right] = \mathbb{E}\left[\alpha_{(0)}\left(U\right)h\left(U, \gamma_-\right)\right]$$

where $h\left(u, \gamma\right) := \int \gamma\left(z\right)p\left(z \mid u\right)d\lambda\left(z\right)$, $\alpha_{(w)}\left(u\right) = \mathbb{E}\left[Y_i\left(w\right) \mid U_i = u\right]$

Sharp RD Design with A Noisy Running Variable

Proposition 1

Let $\gamma_+(\cdot), \gamma_-(\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+(Z)Y\right] = \mathbb{E}\left[\alpha_{(1)}(U)h(U, \gamma_+)\right], \qquad \mathbb{E}\left[\gamma_-(Z)Y\right] = \mathbb{E}\left[\alpha_{(0)}(U)h(U, \gamma_-)\right]$$

where $h(u, \gamma) := \int \gamma(z)p(z \mid u)\,d\lambda(z)$, $\alpha_{(w)}(u) = \mathbb{E}\left[Y_i(w) \mid U_i = u\right]$

Sharp RD Design with A Noisy Running Variable

Proposition 1

Let $\gamma_+(\cdot), \gamma_-(\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+(Z)Y\right] = \mathbb{E}\left[\alpha_{(1)}(U)h(U,\gamma_+)\right], \qquad \mathbb{E}\left[\gamma_-(Z)Y\right] = \mathbb{E}\left[\alpha_{(0)}(U)h(U,\gamma_-)\right]$$

where $h(u,\gamma) := \int \gamma(z)p(z \mid u)\,\mathrm{d}\lambda(z)$, $\alpha_{(w)}(u) = \mathbb{E}[Y_i(w) \mid U_i = u]$

- $\mathbb{E}\left[Y^2\right], \mathbb{E}\left[\gamma_-(Z)^2\right], \mathbb{E}\left[\gamma_+(Z)^2\right] < \infty$

Sharp RD Design with A Noisy Running Variable

Proposition 1

Let $\gamma_+(\cdot), \gamma_-(\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+(Z)Y\right] = \mathbb{E}\left[\alpha_{(1)}(U)h(U,\gamma_+)\right], \qquad \mathbb{E}\left[\gamma_-(Z)Y\right] = \mathbb{E}\left[\alpha_{(0)}(U)h(U,\gamma_-)\right]$$

where $h(u,\gamma) \coloneqq \int \gamma(z)p(z \mid u)\,\mathrm{d}\lambda(z)$, $\alpha_{(w)}(u) = \mathbb{E}\left[Y_i(w) \mid U_i = u\right]$

- $\mathbb{E}\left[Y^2\right], \mathbb{E}\left[\gamma_-(Z)^2\right], \mathbb{E}\left[\gamma_+(Z)^2\right] < \infty$
- $\gamma_+(\cdot), \gamma_-(\cdot)$ are weighting functions s.t.

Sharp RD Design with A Noisy Running Variable

Proposition 1

Let $\gamma_+(\cdot), \gamma_-(\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+(Z)Y\right] = \mathbb{E}\left[\alpha_{(1)}(U)h(U, \gamma_+)\right], \qquad \mathbb{E}\left[\gamma_-(Z)Y\right] = \mathbb{E}\left[\alpha_{(0)}(U)h(U, \gamma_-)\right]$$

where $h(u, \gamma) \coloneqq \int \gamma(z)p(z \mid u)\,d\lambda(z)$, $\alpha_{(w)}(u) = \mathbb{E}\left[Y_i(w) \mid U_i = u\right]$

- $\mathbb{E}\left[Y^2\right], \mathbb{E}\left[\gamma_-(Z)^2\right], \mathbb{E}\left[\gamma_+(Z)^2\right] < \infty$
- $\gamma_+(\cdot), \gamma_-(\cdot)$ are weighting functions s.t.
  - $\gamma_+(z) = 0$ for $z < c$: assign non-zero weights only to **treated** units

Sharp RD Design with A Noisy Running Variable

Proposition 1

Let $\gamma_+(\cdot), \gamma_-(\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+(Z)Y\right] = \mathbb{E}\left[\alpha_{(1)}(U)h(U,\gamma_+)\right], \qquad \mathbb{E}\left[\gamma_-(Z)Y\right] = \mathbb{E}\left[\alpha_{(0)}(U)h(U,\gamma_-)\right]$$

where $h(u,\gamma) := \int \gamma(z)p(z\mid u)\,\mathrm{d}\lambda(z)$, $\alpha_{(w)}(u) = \mathbb{E}\left[Y_i(w)\mid U_i = u\right]$

- $\mathbb{E}\left[Y^2\right], \mathbb{E}\left[\gamma_-(Z)^2\right], \mathbb{E}\left[\gamma_+(Z)^2\right] < \infty$
- $\gamma_+(\cdot), \gamma_-(\cdot)$ are weighting functions s.t.
  - $\gamma_+(z) = 0$ for $z < c$: assign non-zero weights only to **treated** units
  - $\gamma_-(z) = 0$ for $z \geq c$: assign non-zero weights only to **control** units

Sharp RD Design with A Noisy Running Variable

Proposition 1

Let $\gamma_+(\cdot), \gamma_-(\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+(Z) Y\right] = \mathbb{E}\left[\alpha_{(1)}(U) h(U, \gamma_+)\right], \qquad \mathbb{E}\left[\gamma_-(Z) Y\right] = \mathbb{E}\left[\alpha_{(0)}(U) h(U, \gamma_-)\right]$$

where $h(u, \gamma) \coloneqq \int \gamma(z) p(z \mid u) \, d\lambda(z)$, $\alpha_{(w)}(u) = \mathbb{E}\left[Y_i(w) \mid U_i = u\right]$

Proof:

$$\mathbb{E}\left[\gamma_+(Z) Y \mid U\right]$$

Sharp RD Design with A Noisy Running Variable

Proposition 1

Let $\gamma_+(\cdot), \gamma_-(\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+(Z) Y\right] = \mathbb{E}\left[\alpha_{(1)}(U) h(U, \gamma_+)\right], \qquad \mathbb{E}\left[\gamma_-(Z) Y\right] = \mathbb{E}\left[\alpha_{(0)}(U) h(U, \gamma_-)\right]$$

where $h(u, \gamma) := \int \gamma(z) p(z \mid u) \, d\lambda(z)$, $\alpha_{(w)}(u) = \mathbb{E}[Y_i(w) \mid U_i = u]$

Estimation

Estimation of Weighted Treatment Effects

Proposition: The Key Argument

Let $\gamma_+(\cdot), \gamma_-(\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+(Z)Y\right] = \mathbb{E}\left[\alpha_{(1)}(U)h(U,\gamma_+)\right], \qquad \mathbb{E}\left[\gamma_-(Z)Y\right] = \mathbb{E}\left[\alpha_{(0)}(U)h(U,\gamma_-)\right]$$

where $h(u,\gamma) \coloneqq \int \gamma(z)p(z \mid u)\,d\lambda(z)$, $\alpha_{(w)}(u) = \mathbb{E}\left[Y_i(w) \mid U_i = u\right]$

ratio-form estimators:

$$\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} \qquad\qquad\qquad -\hat{\mu}_{\gamma,-}$$
$$= \frac{\sum_i \gamma_+(Z_i)Y_i}{\sum_i \underbrace{\gamma_+(Z_i)}} \qquad\qquad -\frac{\sum_i \gamma_-(Z_i)Y_i}{\sum_i \underbrace{\gamma_-(Z_i)}}$$

Estimation of Weighted Treatment Effects

Proposition: The Key Argument

Let $\gamma_+ (\cdot), \gamma_- (\cdot)$ be measurable functions of Z, then under A1-A3:

$$\mathbb{E}\left[\gamma_+ (Z) Y\right] = \mathbb{E}\left[\alpha_{(1)} (U) h (U, \gamma_+)\right], \qquad \mathbb{E}\left[\gamma_- (Z) Y\right] = \mathbb{E}\left[\alpha_{(0)} (U) h (U, \gamma_-)\right]$$

where $h (u, \gamma) := \int \gamma (z) p (z \mid u) \, d\lambda (z)$, $\alpha_{(w)} (u) = \mathbb{E}\left[Y_i (w) \mid U_i = u\right]$

ratio-form estimators:

$$
\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} \\
= \frac{\sum_i \gamma_+ (Z_i) Y_i}{\sum_i \underbrace{\gamma_+ (Z_i)}_{\gamma_+(z)=0, z<c}}
\qquad\qquad
\begin{aligned}
&-\hat{\mu}_{\gamma,-} \\
&-\frac{\sum_i \gamma_- (Z_i) Y_i}{\sum_i \underbrace{\gamma_- (Z_i)}_{\gamma_-(z)=0, z<\geq c}}
\end{aligned}
$$

Estimation of Weighted Treatment Effects

Ratio-form estimators:

$$\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-} = \frac{\sum_i \gamma_+ (Z_i) Y_i}{\sum_i \gamma_+ (Z_i)} - \frac{\sum_i \gamma_- (Z_i) Y_i}{\sum_i \gamma_- (Z_i)}$$

What's the weighted treatment effects to conduct inference for?

Estimation of Weighted Treatment Effects

Ratio-form estimators:

$$\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-} = \frac{\sum_i \gamma_+ (Z_i) Y_i}{\sum_i \gamma_+ (Z_i)} - \frac{\sum_i \gamma_- (Z_i) Y_i}{\sum_i \gamma_- (Z_i)}$$

What's the weighted treatment effects to conduct inference for?

$$\tau_w = \int \frac{w (u)}{\mathbb{E}_G [w (U)]} \tau (u) \mathrm{d}G (u) , w (\cdot) \geq 0$$

Estimation of Weighted Treatment Effects

Ratio-form estimators:

$$\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-} = \frac{\sum_i \gamma_+ (Z_i) Y_i}{\sum_i \gamma_+ (Z_i)} - \frac{\sum_i \gamma_- (Z_i) Y_i}{\sum_i \gamma_- (Z_i)}$$

What's the weighted treatment effects to conduct inference for?

$$\tau_w = \int \frac{w (u)}{\mathbb{E}_G [w (U)]} \tau (u) \mathrm{d}G (u) , w (\cdot) \geq 0$$

where $\tau(u)$ **(Conditional Average Treatment Effects)** is

$$\tau (u) = \mathbb{E} [Y_i (1) - Y_i (0) \mid U_i = u] = \alpha_{(1)} (u) - \alpha_{(0)} (u)$$

Weighted Treatment Effects: Example

$$\tau_w = \int \frac{w(u)}{\mathbb{E}_G[w(U)]} \tau(u) \mathrm{d}G(u), w(\cdot) \geq 0$$

where $\tau(u)$ **(CATE)** is $\tau(u) = \mathbb{E}[Y_i(1) - Y_i(0) \mid U_i = u] = \alpha_{(1)}(u) - \alpha_{(0)}(u)$

- RD paramater:

$$\tau_c = \mathbb{E}[Y_i(1) - Y_i(0) \mid Z_i = c] = \mathbb{E}[\tau(U_i) \mid Z_i = c]$$
$$= \int \frac{p(c \mid u)}{\int p(c \mid u) \mathrm{d}G(u)} \tau(u) \mathrm{d}G(u)$$

Weighted Treatment Effects: Example

$$\tau_w = \int \frac{w\left(u\right)}{\mathbb{E}_G\left[w\left(U\right)\right]}\tau\left(u\right)\mathrm{d}G\left(u\right), w\left(\cdot\right) \geq 0$$

where $\tau(u)$ **(CATE)** is $\tau\left(u\right) = \mathbb{E}\left[Y_i\left(1\right) - Y_i\left(0\right) \mid U_i = u\right] = \alpha_{(1)}\left(u\right) - \alpha_{(0)}\left(u\right)$

- RD paramater:

$$\begin{aligned}
\tau_c = \mathbb{E}\left[Y_i\left(1\right) - Y_i\left(0\right) \mid Z_i = c\right] &= \mathbb{E}\left[\tau(U_i) \mid Z_i = c\right] \\
&= \int \frac{p\left(c \mid u\right)}{\underbrace{\int p\left(c \mid u\right)\mathrm{d}G\left(u\right)}_{=f_G(c)}}\tau\left(u\right)\mathrm{d}G\left(u\right)
\end{aligned}$$

Asymptotic Bias

Theorem: Asymptotic Limit of $\hat{\tau}_\gamma$

$$\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-} = \qquad \frac{\sum_i \gamma_+ (Z_i) Y_i}{\sum_i \gamma_+ (Z_i)} \qquad - \qquad \frac{\sum_i \gamma_- (Z_i) Y_i}{\sum_i \gamma_- (Z_i)}$$

Asymptotic Bias

Theorem: Asymptotic Limit of $\hat{\tau}_\gamma$

$$\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-} = \qquad \frac{\sum_i \gamma_+ (Z_i) \, Y_i}{\sum_i \gamma_+ (Z_i)} \quad - \quad \frac{\sum_i \gamma_- (Z_i) \, Y_i}{\sum_i \gamma_- (Z_i)}$$

$$\xrightarrow{p} \qquad \frac{\mathbb{E}\left[\gamma_+(Z)Y\right]}{\mathbb{E}\left[\gamma_+(Z)\right]} \quad - \quad \frac{\mathbb{E}\left[\gamma_-(Z)Y\right]}{\mathbb{E}\left[\gamma_-(Z)\right]}$$

Asymptotic Bias

Theorem: Asymptotic Limit of $\hat{\tau}_\gamma$

$$\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-} = \qquad \frac{\sum_i \gamma_+(Z_i) Y_i}{\sum_i \gamma_+(Z_i)} \quad - \quad \frac{\sum_i \gamma_-(Z_i) Y_i}{\sum_i \gamma_-(Z_i)}$$

$$\xrightarrow{p} \qquad \frac{\mathbb{E}[\gamma_+(Z)Y]}{\mathbb{E}[\gamma_+(Z)]} \quad - \quad \frac{\mathbb{E}[\gamma_-(Z)Y]}{\mathbb{E}[\gamma_-(Z)]}$$

$$\textbf{(Prop.1)} = \quad \frac{\mathbb{E}\left[\alpha_{(1)}(U) h(U, \gamma_+)\right]}{\mathbb{E}\left[h(U, \gamma_+)\right]} \quad - \quad \frac{\mathbb{E}\left[\alpha_{(0)}(U) h(U, \gamma_-)\right]}{\mathbb{E}\left[h(U, \gamma_-)\right]} = \mu_{\gamma,+} - \mu_{\gamma,-} \equiv \theta_\gamma$$

where

$$h(u, \gamma) := \int \gamma(z) p(z \mid u) \, \mathrm{d}\lambda(z), \ \alpha_{(w)}(u) = \mathbb{E}\left[Y_i(w) \mid U_i = u\right]$$

Asymptotic Bias

Theorem: Asymptotic Limit of $\hat{\tau}_\gamma$

$$\hat{\tau}_\gamma = \hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-} = \quad \frac{\sum_i \gamma_+ (Z_i) Y_i}{\sum_i \gamma_+ (Z_i)} \quad - \quad \frac{\sum_i \gamma_- (Z_i) Y_i}{\sum_i \gamma_- (Z_i)}$$

$$\xrightarrow{p} \quad \frac{\mathbb{E}\left[\alpha_{(1)} (U) h (U, \gamma_+)\right]}{\mathbb{E}\left[h (U, \gamma_+)\right]} \quad - \quad \frac{\mathbb{E}\left[\alpha_{(0)} (U) h (U, \gamma_-)\right]}{\mathbb{E}\left[h (U, \gamma_-)\right]} = \mu_{\gamma,+} - \mu_{\gamma,-} \equiv \theta_\gamma$$

How biased is this asymptotic limit? Comparing to

$$\tau_w = \int \frac{w (u)}{\mathbb{E}_G \left[w (U)\right]} \tau (u) \mathrm{d}G (u) , w (\cdot) \geq 0$$

Asymptotic Bias: Decomposition

$$a\mathrm{Bias}\left[\gamma_\pm, \tau_w; \alpha_{(0)}\left(\cdot\right), \tau\left(\cdot\right), G\right] = \theta_\gamma - \tau_w$$

Asymptotic Bias: Decomposition

$$
a\text{Bias}\left[\gamma_{\pm}, \tau_w; \alpha_{(0)}\left(\cdot\right), \tau\left(\cdot\right), G\right] = \theta_{\gamma} - \tau_w
$$
$$
= \frac{\mathbb{E}\left[\alpha_{(1)}\left(U\right) h\left(U, \gamma_{+}\right)\right]}{\mathbb{E}\left[h\left(U, \gamma_{+}\right)\right]} - \frac{\mathbb{E}\left[\alpha_{(0)}\left(U\right) h\left(U, \gamma_{-}\right)\right]}{\mathbb{E}\left[h\left(U, \gamma_{-}\right)\right]} - \int \frac{w\left(u\right)}{\mathbb{E}_G\left[w\left(U\right)\right]}\tau\left(u\right)\,\mathrm{d}G\left(u\right)
$$

Asymptotic Bias: Decomposition

$$
\begin{aligned}
&a\text{Bias}\left[\gamma_{\pm}, \tau_w; \alpha_{(0)}\left(\cdot\right), \tau\left(\cdot\right), G\right] = \theta_\gamma - \tau_w \\
=& \frac{\mathbb{E}\left[\alpha_{(1)}\left(U\right) h\left(U, \gamma_+\right)\right]}{\mathbb{E}\left[h\left(U, \gamma_+\right)\right]} - \frac{\mathbb{E}\left[\alpha_{(0)}\left(U\right) h\left(U, \gamma_-\right)\right]}{\mathbb{E}\left[h\left(U, \gamma_-\right)\right]} - \int \frac{w\left(u\right)}{\mathbb{E}_G\left[w\left(U\right)\right]} \tau\left(u\right) \mathrm{d}G\left(u\right) \\
=& \int \left(\frac{h\left(u, \gamma_+\right)}{\mathbb{E}_G\left[h\left(U, \gamma_+\right)\right]}\right) \alpha_{(1)}\left(u\right) \mathrm{d}G\left(u\right) - \int \left(\frac{h\left(u, \gamma_-\right)}{\mathbb{E}_G\left[h\left(U, \gamma_-\right)\right]}\right) \alpha_{(0)}\left(u\right) \mathrm{d}G\left(u\right) \\
& - \int \frac{w\left(u\right)}{\mathbb{E}_G\left[w\left(U\right)\right]} \tau\left(u\right) \mathrm{d}G\left(u\right)
\end{aligned}
$$

Asymptotic Bias: Decomposition

$$
a\text{Bias}\left[\gamma_{\pm}, \tau_w; \alpha_{(0)}\left(\cdot\right), \tau\left(\cdot\right), G\right] = \theta_{\gamma} - \tau_w
$$

$$
= \frac{\mathbb{E}\left[\alpha_{(1)}\left(U\right) h\left(U, \gamma_+\right)\right]}{\mathbb{E}\left[h\left(U, \gamma_+\right)\right]} - \frac{\mathbb{E}\left[\alpha_{(0)}\left(U\right) h\left(U, \gamma_-\right)\right]}{\mathbb{E}\left[h\left(U, \gamma_-\right)\right]} - \int \frac{w\left(u\right)}{\mathbb{E}_G\left[w\left(U\right)\right]} \tau\left(u\right) \mathrm{d}G\left(u\right)
$$

$$
= \int \left(\frac{h\left(u, \gamma_+\right)}{\mathbb{E}_G\left[h\left(U, \gamma_+\right)\right]}\right) \alpha_{(1)}\left(u\right) \mathrm{d}G\left(u\right) - \int \left(\frac{h\left(u, \gamma_-\right)}{\mathbb{E}_G\left[h\left(U, \gamma_-\right)\right]}\right) \alpha_{(0)}\left(u\right) \mathrm{d}G\left(u\right)
$$

$$
- \int \frac{w\left(u\right)}{\mathbb{E}_G\left[w\left(U\right)\right]} \tau\left(u\right) \mathrm{d}G\left(u\right)
$$

Remember? $\tau(u)$ **(Conditional Average Treatment Effects)** is

$$
\tau\left(u\right) = \mathbb{E}\left[Y_i\left(1\right) - Y_i\left(0\right) \mid U_i = u\right] = \alpha_{(1)}\left(u\right) - \alpha_{(0)}\left(u\right) \Rightarrow \boxed{\alpha_{(1)}(u) = \tau(u) + \alpha_{(0)}(u)}
$$

Asymptotic Bias: Decomposition

$$
\begin{aligned}
&a\text{Bias}\left[\gamma_{\pm}, \tau_w; \alpha_{(0)}\left(\cdot\right), \tau\left(\cdot\right), G\right] = \theta_\gamma - \tau_w \\
&= \int \left(\frac{h\left(u, \gamma_+\right)}{\mathbb{E}_G\left[h\left(U, \gamma_+\right)\right]}\right) \underbrace{\alpha_{(1)}\left(u\right)}_{=\tau(u)+\alpha_{(0)}(u)} \mathrm{d}G\left(u\right) \\
&\quad - \int \left(\frac{h\left(u, \gamma_-\right)}{\mathbb{E}_G\left[h\left(U, \gamma_-\right)\right]}\right) \alpha_{(0)}\left(u\right) \mathrm{d}G\left(u\right) - \int \frac{w\left(u\right)}{\mathbb{E}_G\left[w\left(U\right)\right]} \tau\left(u\right) \mathrm{d}G\left(u\right)
\end{aligned}
$$

Asymptotic Bias: Decomposition

  How well the units are **balanced** via the latent variable u
- **CATE heterogeneity bias:**
  - $\tau(u)$ being constant w.r.t. u, a constant conditional treatment effect
  - $h(u, \gamma_+) = w(u), \forall u$, an absolutely "correct" weighting function

Confidence Intervals

Asymptotic Normality

$$\hat{\tau} = \frac{\sum_i \gamma_+ (Z_i) Y_i}{\sum_i \gamma_+ (Z_i)} - \frac{\sum_i \gamma_- (Z_i) Y_i}{\sum_i \gamma_- (Z_i)}$$

$$\hat{\tau}_\gamma \xrightarrow{p} \theta_\gamma = \frac{\mathbb{E}\left[\alpha_{(1)}(U) h(U, \gamma_+)\right]}{\mathbb{E}\left[h(U, \gamma_+)\right]} - \frac{\mathbb{E}\left[\alpha_{(0)}(U) h(U, \gamma_-)\right]}{\mathbb{E}\left[h(U, \gamma_-)\right]}$$

Asymptotic Normality

Theorem: Asymptotic Normality of $\hat{\tau}$

Suppose the sequence of weighting kernels $\gamma_+^{(n)}$ and $\gamma_-^{(n)}$ is deterministic, and $\exists \beta \in \left(0, \frac{1}{2}\right), C, C' > 0$ s.t. $\forall n$ large enough:

$$\sup_z \left| \gamma_\diamond^{(n)}(z) \right| < Cn^\beta \mathbb{E}\left[\gamma_\diamond^{(n)}(Z_i) \right] \qquad \sup_u \left| h\left(u, \gamma_\diamond^{(n)}\right) \right| < C' \mathbb{E}\left[\gamma_\diamond^{(n)}(Z_i) \right], \qquad \diamond = \{+, -\}$$

Then

$$\frac{\sqrt{n}\left(\hat{\tau}_\gamma - \theta_\gamma\right)}{\sqrt{V_\gamma}} \xrightarrow{d} \mathcal{N}(0, 1)$$

where

$$V_\gamma = \frac{\mathbb{E}\left[\gamma_+^2(Z_i)(Y_i - \mu_{\gamma,+})^2 \right]}{\mathbb{E}\left[\gamma_+(Z_i) \right]^2} + \frac{\mathbb{E}\left[\gamma_-^2(Z_i)(Y_i - \mu_{\gamma,-})^2 \right]}{\mathbb{E}\left[\gamma_-(Z_i) \right]^2}$$

Asymptotic Normality

Theorem: Asymptotic Normality of $\hat{\tau}$

Suppose the sequence of weighting kernels $\gamma_+^{(n)}$ and $\gamma_-^{(n)}$ is deterministic, and $\exists \beta \in \left(0, \frac{1}{2}\right), C, C' > 0$ s.t. $\forall n$ large enough: $\sup_z \left| \gamma_\diamond^{(n)}(z) \right| < Cn^\beta \mathbb{E}\left[\gamma_\diamond^{(n)}(Z_i) \right]$, $\sup_u \left| h\left(u, \gamma_\diamond^{(n)}\right) \right| < C' \mathbb{E}\left[\gamma_\diamond^{(n)}(Z_i) \right]$ where $\diamond = \{+, -\}$ Then

$$\frac{\sqrt{n}\left(\hat{\tau}_\gamma - \theta_\gamma\right)}{\sqrt{V_\gamma}} \xrightarrow{d} \mathcal{N}(0, 1)$$

where $V_\gamma = \frac{\mathbb{E}\left[\gamma_+^2(Z_i)(Y_i - \mu_{\gamma,+})^2\right]}{\mathbb{E}[\gamma_+(Z_i)]^2} + \frac{\mathbb{E}\left[\gamma_-^2(Z_i)(Y_i - \mu_{\gamma,-})^2\right]}{\mathbb{E}[\gamma_-(Z_i)]^2}$

Assumption:

- The repsonse Y_i is bounded: $Y_i \in [0, 1]$
- $\inf_z \text{Var}\left[Y_i \mid Z_i = z\right] > 0$

Asymptotic Normality: A Sketch of the Proof

$$\frac{\sqrt{n}\left[(\hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-}) - (\mu_{\gamma,+} - \mu_{\gamma,-})\right]}{\sqrt{\frac{\mathbb{E}\left[\gamma_+^2(Z_i)(Y_i - \mu_{\gamma,+})^2\right]}{\mathbb{E}\left[\gamma_+(Z_i)\right]^2} + \frac{\mathbb{E}\left[\gamma_-^2(Z_i)(Y_i - \mu_{\gamma,-})^2\right]}{\mathbb{E}\left[\gamma_-(Z_i)\right]^2}}} \xrightarrow{d} \mathcal{N}(0,1)$$

Asymptotic Normality: A Sketch of the Proof

$$\frac{\sqrt{n}\left[(\hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-}) - (\mu_{\gamma,+} - \mu_{\gamma,-})\right]}{\sqrt{\frac{\mathbb{E}\left[\gamma_+^2(Z_i)(Y_i - \mu_{\gamma,+})^2\right]}{\mathbb{E}\left[\gamma_+(Z_i)\right]^2} + \frac{\mathbb{E}\left[\gamma_-^2(Z_i)(Y_i - \mu_{\gamma,-})^2\right]}{\mathbb{E}\left[\gamma_-(Z_i)\right]^2}}} \xrightarrow{d} \mathcal{N}(0,1)$$

$$\frac{\sqrt{n}\left(\hat{\mu}_{\gamma,+} - \mu_{\gamma,+}\right)}{\sqrt{\frac{\mathbb{E}\left[\gamma_+(Z_i)^2(Y_i(1) - \mu_{\gamma,+})^2\right]}{\mathbb{E}\left[\gamma_+(Z_i)\right]^2}}} \xrightarrow{d} \mathcal{N}(0,1)$$

Asymptotic Normality: A Sketch of the Proof

$$\frac{\frac{1}{n}\sum_i \gamma_+ (Z_i)}{\mathbb{E}\left[\gamma_+ (Z_i)\right]} \xrightarrow{p} 1$$

- $\boxed{\sup_z \left|\gamma_\diamond^{(n)} (z)\right| < Cn^\beta \mathbb{E}\left[\gamma_\diamond^{(n)} (Z_i)\right]}$ and Chebyshev's inequality:

$$\mathbf{P}\left\{\left|\mathbb{E}_n\left[\gamma_+ (Z_i)\right] - \mathbb{E}\left[\gamma_+ (Z_i)\right]\right| \geq \epsilon\mathbb{E}\left[\gamma_+ (Z_i)\right]\right\} \leq \frac{\mathrm{Var}\left[\gamma_+ (Z_i)\right]}{n\epsilon^2\mathbb{E}\left[\gamma_+ (Z_i)\right]^2}$$
$$\leq \left(\frac{C}{\epsilon} \cdot n^{\beta-\frac{1}{2}}\right)^2 \xrightarrow{n\to\infty} 0$$

Asymptotic Normality: A Sketch of the Proof

$$\frac{\frac{\sum_i \gamma_+(Z_i)(Y_i(1)-\mu_{\gamma,+})}{\sum_i \gamma_+(Z_i)}}{\frac{\sqrt{n\mathbb{E}[\gamma_+(Z_i)^2(Y_i(1)-\mu_{\gamma,+})^2]}}{n\mathbb{E}[\gamma_+(Z_i)]}} = \underbrace{\frac{\sum_i \gamma_+(Z_i)(Y_i(1)-\mu_{\gamma,+})}{\sqrt{n\mathbb{E}\left[\gamma_+(Z_i)^2(Y_i(1)-\mu_{\gamma,+})^2\right]}}}_{\xrightarrow{d}\mathcal{N}(0,1)} \cdot \underbrace{\frac{1}{\frac{\frac{1}{n}\sum_i \gamma_+(Z_i)}{\mathbb{E}[\gamma_+(Z_i)]}}}_{=1+o_p(1)} \xrightarrow{d} \mathcal{N}(0,1)$$

$$\Rightarrow \frac{\sqrt{n}\left(\frac{\sum_i \gamma_+(Z_i)Y_i}{\sum_i \gamma_+(Z_i)}-\mu_{\gamma,+}\right)}{\sqrt{\frac{\mathbb{E}[\gamma_+(Z_i)^2(Y_i(1)-\mu_{\gamma,+})^2]}{\mathbb{E}[\gamma_+(Z_i)]^2}}} \xrightarrow{d} \mathcal{N}(0,1) \Rightarrow \frac{\sqrt{n}(\hat{\tau}_\gamma - \theta_\gamma)}{\sqrt{V_\gamma}} \xrightarrow{d} \mathcal{N}(0,1)$$

Plug-in Estimator for V_γ

$$V_\gamma = \frac{\mathbb{E}\left[\gamma_+^2\left(Z_i\right)\left(Y_i - \mu_{\gamma,+}\right)^2\right]}{\mathbb{E}\left[\gamma_+\left(Z_i\right)\right]^2} + \frac{\mathbb{E}\left[\gamma_-^2\left(Z_i\right)\left(Y_i - \mu_{\gamma,-}\right)^2\right]}{\mathbb{E}\left[\gamma_-\left(Z_i\right)\right]^2}$$

Plug-in Estimator for V_γ

$$V_\gamma = \frac{\mathbb{E}\left[\gamma_+^2\left(Z_i\right)\left(Y_i - \mu_{\gamma,+}\right)^2\right]}{\mathbb{E}\left[\gamma_+\left(Z_i\right)\right]^2} + \frac{\mathbb{E}\left[\gamma_-^2\left(Z_i\right)\left(Y_i - \mu_{\gamma,-}\right)^2\right]}{\mathbb{E}\left[\gamma_-\left(Z_i\right)\right]^2}$$

Proposition: Plug-in Estimator $\hat{V}_\gamma$

Under the same assumptions, we have $\frac{\hat{V}_\gamma}{V_\gamma} = 1 + o_p(1)$ where

$$\hat{V}_\gamma = \frac{\frac{1}{n}\sum_{i=1}^n \gamma_+^2\left(Z_i\right)\left(Y_i - \hat{\mu}_{\gamma,+}\right)^2}{\left[\frac{1}{n}\sum_{i=1}^n \gamma_+\left(Z_i\right)\right]^2} + \frac{\frac{1}{n}\sum_{i=1}^n \gamma_-^2\left(Z_i\right)\left(Y_i - \hat{\mu}_{\gamma,-}\right)^2}{\left[\frac{1}{n}\sum_{i=1}^n \gamma_-\left(Z_i\right)\right]^2}$$

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

$$a\text{Bias} = \theta_\gamma - \tau_w = \underbrace{\int \left(\frac{h(u, \gamma_+)}{\mathbb{E}_G [h(U, \gamma_+)]} - \frac{h(u, \gamma_-)}{\mathbb{E}_G [h(U, \gamma_-)]} \right) \alpha_{(0)}(u) \, dG(u)}_{\text{Confounding bias}}$$

$$+ \underbrace{\int \left(\frac{h(u, \gamma_+)}{\mathbb{E}_G [h(U, \gamma_+)]} - \frac{w(u)}{\mathbb{E}_G [w(U)]} \right) \tau(u) \, dG(u)}_{\text{CATE heterogeneity bias}}$$

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

$$a\text{Bias} = \theta_\gamma - \tau_w = \underbrace{\int \left(\frac{h(u, \gamma_+)}{\mathbb{E}_G [h(U, \gamma_+)]} - \frac{h(u, \gamma_-)}{\mathbb{E}_G [h(U, \gamma_-)]} \right) \alpha_{(0)}(u) \, dG(u)}_{\text{Confounding bias}}$$

$$+ \underbrace{\int \left(\frac{h(u, \gamma_+)}{\mathbb{E}_G [h(U, \gamma_+)]} - \frac{w(u)}{\mathbb{E}_G [w(U)]} \right) \tau(u) \, dG(u)}_{\text{CATE heterogeneity bias}}$$

The distribution of $G(\cdot)$ is **unknown**

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

Bound the **worst-case** bias:

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

Bound the **worst-case** bias:

- Back out the class of latent variable distribution from $\hat{F}_n(t) = \frac{1}{n} \sum_{i=1}^{n} \mathbf{1}(Z_i \leq t)$, the empirical distribution of Z_i (Massart, 1990):

$$\mathcal{G}_n = \left\{ G(\cdot) : \sup_{t \in \mathbb{R}} \left| F_G(t) - \hat{F}_n(t) \right| \leq \sqrt{\frac{\log(2/\alpha_n)}{2n}} \right\}, \quad \alpha_n = \min\left\{0.05, n^{-1/4}\right\}$$

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

Bound the **worst-case** bias:

- Back out the class of latent variable distribution from $\hat{F}_n(t) = \frac{1}{n} \sum_{i=1}^{n} \mathbf{1}(Z_i \leq t)$, the empirical distribution of Z_i (Massart, 1990):

$$\mathcal{G}_n = \left\{ G(\cdot) : \sup_{t \in \mathbb{R}} \left| F_G(t) - \hat{F}_n(t) \right| \leq \sqrt{\frac{\log(2/\alpha_n)}{2n}} \right\}, \quad \alpha_n = \min \left\{ 0.05, n^{-1/4} \right\}$$

- Take treatment effect heterogeneity into consideration:

$$\mathcal{T}_M = \left\{ \tau(\cdot) \mid \tau(u) = \bar{\tau} + \Delta(u), \bar{\tau} \in \mathbb{R}, |\Delta(u)| \leq M \right\}, \qquad M \in [0, 1]$$

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

Bound the **worst-case** bias:

- Back out the class of latent variable distribution from $\hat{F}_n(t) = \frac{1}{n} \sum_{i=1}^{n} \mathbf{1}(Z_i \leq t)$, the empirical distribution of Z_i (Massart, 1990):

$$\mathcal{G}_n = \left\{ G(\cdot) : \sup_{t \in \mathbb{R}} \left| F_G(t) - \hat{F}_n(t) \right| \leq \sqrt{\frac{\log(2/\alpha_n)}{2n}} \right\}, \quad \alpha_n = \min\left\{ 0.05, n^{-1/4} \right\}$$

- Take treatment effect heterogeneity into consideration:

$$\mathcal{T}_M = \left\{ \tau(\cdot) \mid \tau(u) = \bar{\tau} + \Delta(u), \bar{\tau} \in \mathbb{R}, |\Delta(u)| \leq M \right\}, \qquad M \in [0, 1]$$

- $\mathcal{T}_0$ ($M = 0$): constant CATE
- $\mathcal{T}_1$ ($M = 1$): no assumptions
- $\mathcal{T}_{1/2}$ ($M = 0$): a conservative choice for a monotonicity restriction

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

Proposition: Upper Bound for the Potential Bias $\hat{B}_{\gamma,M}$

Under asymptotic normality and all necessary assumptions, for $\tau(\cdot) \in \mathcal{T}_M$, the upper bound of bias is

$$\hat{B}_{\gamma,M} = \sup \left\{ |\text{Bias}\left[\gamma_\pm, \tau_w; \alpha_0\left(\cdot\right), \tau\left(\cdot\right), G\right]| : G \in \mathcal{G}_n, \alpha_{(0)}\left(\cdot\right) \in [0,1], \tau\left(\cdot\right) \in \mathcal{T}_M \right\}$$

then $\mathbf{P}\left(|b_\gamma| \le \hat{B}_{\gamma,M}\right) \xrightarrow{n \to \infty} 1$

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

Proposition: Upper Bound for the Potential Bias $\hat{B}_{\gamma,M}$

Under asymptotic normality and all necessary assumptions, for $\tau(\cdot) \in \mathcal{T}_M$, the upper bound of bias is

$$\hat{B}_{\gamma,M} = \sup\left\{|\text{Bias}\left[\gamma_\pm, \tau_w; \alpha_0\left(\cdot\right), \tau\left(\cdot\right), G\right]| : G \in \mathcal{G}_n, \alpha_{(0)}\left(\cdot\right) \in [0,1], \tau\left(\cdot\right) \in \mathcal{T}_M\right\}$$

then $\mathbf{P}\left(|b_\gamma| \leq \hat{B}_{\gamma,M}\right) \xrightarrow{n \to \infty} 1$

$$\{G \in \mathcal{G}_n\} \subset \left\{|b_\gamma| \leq \hat{B}_{\gamma,M}\right\} \Rightarrow \mathbf{P}\left(|b_\gamma| \leq \hat{B}_{\gamma,M}\right) \geq \mathbf{P}\left(G \in \mathcal{G}_n\right)$$

Upper Bound for the Potential Bias $|b_\gamma| = |\theta_\gamma - \tau_w|$

Proposition: Upper Bound for the Potential Bias $\hat{B}_{\gamma,M}$

Under asymptotic normality and all necessary assumptions, for $\tau(\cdot) \in \mathcal{T}_M$, the upper bound of bias is

$$\hat{B}_{\gamma,M} = \sup \left\{ |\text{Bias}\left[\gamma_\pm, \tau_w; \alpha_0\left(\cdot\right), \tau\left(\cdot\right), G\right]| : G \in \mathcal{G}_n, \alpha_{(0)}\left(\cdot\right) \in [0,1], \tau\left(\cdot\right) \in \mathcal{T}_M \right\}$$

then $\mathbf{P}\left(|b_\gamma| \leq \hat{B}_{\gamma,M}\right) \xrightarrow{n \to \infty} 1$

$$\left\{ G \in \mathcal{G}_n \right\} \subset \left\{ |b_\gamma| \leq \hat{B}_{\gamma,M} \right\} \Rightarrow \mathbf{P}\left(|b_\gamma| \leq \hat{B}_{\gamma,M}\right) \geq \mathbf{P}\left(G \in \mathcal{G}_n\right)$$

and for $G \in \mathcal{G}_n$, Dvoretzky-Kiefer-Wolfowitz (DKW) inequality gives:

$$\mathbf{P}\left(G \in \mathcal{G}_n\right) \geq \mathbf{P}\left[\sup_{t \in \mathbb{R}} \left| F_G\left(t\right) - \hat{F}_n\left(t\right) \right| \leq \sqrt{\frac{\log\left(2/\alpha_n\right)}{2n}}\right] \geq 1 - \alpha_n \xrightarrow[n \to \infty]{\alpha_n = \min\left\{0.05, n^{-1/4}\right\}} 1$$

Recap: What We Have Derived

Recap: What We Have Derived

- Asymptotic limit:

$$\hat{\tau}_\gamma \xrightarrow{p} \theta_\gamma = \frac{\mathbb{E}\left[\alpha_{(1)}\left(U\right)h\left(U,\gamma_+\right)\right]}{\mathbb{E}\left[h\left(U,\gamma_+\right)\right]} - \frac{\mathbb{E}\left[\alpha_{(0)}\left(U\right)h\left(U,\gamma_-\right)\right]}{\mathbb{E}\left[h\left(U,\gamma_-\right)\right]}$$

Recap: What We Have Derived

- Asymptotic limit:

$$\hat{\tau}_\gamma \xrightarrow{p} \theta_\gamma = \frac{\mathbb{E}\left[\alpha_{(1)}\left(U\right)h\left(U,\gamma_+\right)\right]}{\mathbb{E}\left[h\left(U,\gamma_+\right)\right]} - \frac{\mathbb{E}\left[\alpha_{(0)}\left(U\right)h\left(U,\gamma_-\right)\right]}{\mathbb{E}\left[h\left(U,\gamma_-\right)\right]}$$

- Asymptotic normality:

$$\frac{\sqrt{n}\left(\hat{\tau}_\gamma - \theta_\gamma\right)}{\sqrt{\hat{V}_\gamma}} \xrightarrow{d} \mathcal{N}\left(0,1\right)$$

Recap: What We Have Derived

- Asymptotic limit:

$$\hat{\tau}_\gamma \xrightarrow{p} \theta_\gamma = \frac{\mathbb{E}\left[\alpha_{(1)}\left(U\right)h\left(U,\gamma_+\right)\right]}{\mathbb{E}\left[h\left(U,\gamma_+\right)\right]} - \frac{\mathbb{E}\left[\alpha_{(0)}\left(U\right)h\left(U,\gamma_-\right)\right]}{\mathbb{E}\left[h\left(U,\gamma_-\right)\right]}$$

- Asymptotic normality:

$$\frac{\sqrt{n}\left(\hat{\tau}_\gamma - \theta_\gamma\right)}{\sqrt{\hat{V}_\gamma}} \xrightarrow{d} \mathcal{N}\left(0,1\right)$$

- Upper bound of the asymptotic bias:

$$\hat{B}_{\gamma,M} = \sup\left\{\left|\mathrm{Bias}\left[\gamma_\pm,\tau_w;\alpha_0\left(\cdot\right),\tau\left(\cdot\right),G\right]\right| : G \in \mathcal{G}_n, \alpha_{(0)}\left(\cdot\right) \in \left[0,1\right], \tau\left(\cdot\right) \in \mathcal{T}_M\right\}$$

Bias-aware Confidence Intervals

Corollary: Valid Confidence Intervals

Under asymptotic normality and all necessary assumptions, for $\tau(\cdot) \in \mathcal{T}_M$, consider the CIs

$$\hat{\tau}_\gamma \pm l_\alpha, \qquad l_\alpha = \min\left\{l : \mathbf{P}\left[\left|b + n^{-\frac{1}{2}}\hat{V}_\gamma^{\frac{1}{2}}\tilde{Z}\right| \leq l\right] \geq 1 - \alpha, \forall\, |b| \leq \hat{B}_{\gamma,M}\right\}$$

where

- $\tilde{Z}$ is a standard Guassian random variable
- $\alpha \in (0,1)$ is the significant level
- $\hat{V}_\gamma$ is an estimate of the sampling variance V_γ

then

$$\lim_{n\to\infty} \inf \mathbf{P}\left[\tau_w \in \hat{\tau}_\gamma \pm l_\alpha\right] \geq 1 - \alpha$$

Bias-aware Confidence Intervals

CLT (with bias considered) is

$$\frac{\sqrt{n}\left(\hat{\tau}_\gamma - \theta_\gamma\right)}{\hat{V}_\gamma^{1/2}} = \frac{\sqrt{n}\left(\hat{\tau}_\gamma - \tau_w - b_\gamma\right)}{\hat{V}_\gamma^{1/2}} \xrightarrow{d} \mathcal{N}\left(0, 1\right)$$

where $b_\gamma = \theta_\gamma - \tau_w$, then let $\tilde{Z} \sim \mathcal{N}\left(0, 1\right)$ we have

$$
\begin{aligned}
\mathbf{P}\left[\tau_w \in \hat{\tau}_\gamma \pm l_\alpha\right] =& \mathbf{P}\left[-l_\alpha - b_\gamma \le \hat{\tau}_\gamma - \tau_w - b_\gamma \le l_\alpha - b_\gamma\right] \\
=& \mathbf{P}\left[-\sqrt{n}\hat{V}_\gamma^{-1/2}\left(l_\alpha + b_\gamma\right) \le \sqrt{n}\hat{V}_\gamma^{-1/2}\left(\hat{\tau}_\gamma - \tau_w - b_\gamma\right) \le \sqrt{n}\hat{V}_\gamma^{-1/2}\left(l_\alpha - b_\gamma\right)\right] \\
=& \mathbb{E}\left(\mathbf{P}\left[-\sqrt{n}\hat{V}_\gamma^{-1/2}\left(l_\alpha + b_\gamma\right) \le \tilde{Z} \le \sqrt{n}\hat{V}_\gamma^{-1/2}\left(l_\alpha - b_\gamma\right)\right] \mid \hat{V}_\gamma, \hat{B}_{\gamma,M}, \hat{\tau}_\gamma\right) + o\left(1\right) \\
=& \mathbb{E}\left[\mathbf{P}\left(-l_\alpha \le n^{-1/2}\hat{V}_\gamma^{1/2}\tilde{Z} + b_\gamma \le l_\alpha\right) \mid \hat{V}_\gamma, \hat{B}_{\gamma,M}, \hat{\tau}_\gamma\right] + o\left(1\right) \\
=& 1 - \alpha + o\left(1\right)
\end{aligned}
$$

Bias-aware Confidence Intervals

CLT (with bias considered) is

$$\frac{\sqrt{n}\left(\hat{\tau}_\gamma - \theta_\gamma\right)}{\hat{V}_\gamma^{1/2}} = \frac{\sqrt{n}\left(\hat{\tau}_\gamma - \tau_w - b_\gamma\right)}{\hat{V}_\gamma^{1/2}} \xrightarrow{d} \mathcal{N}\left(0,1\right)$$

where $b_\gamma = \theta_\gamma - \tau_w$, then let $\tilde{Z} \sim \mathcal{N}\left(0,1\right)$ we have

$$\begin{aligned}
\mathbf{P}\left[\tau_w \in \hat{\tau}_\gamma \pm l_\alpha\right] =& \mathbf{P}\left[-l_\alpha - b_\gamma \le \hat{\tau}_\gamma - \tau_w - b_\gamma \le l_\alpha - b_\gamma\right]\\
=& \mathbf{P}\left[-\sqrt{n}\hat{V}_\gamma^{-1/2}\left(l_\alpha + b_\gamma\right) \le \sqrt{n}\hat{V}_\gamma^{-1/2}\left(\hat{\tau}_\gamma - \tau_w - b_\gamma\right) \le \sqrt{n}\hat{V}_\gamma^{-1/2}\left(l_\alpha - b_\gamma\right)\right]\\
=& \mathbb{E}\left(\mathbf{P}\left[-\sqrt{n}\hat{V}_\gamma^{-1/2}\left(l_\alpha + b_\gamma\right) \le \tilde{Z} \le \sqrt{n}\hat{V}_\gamma^{-1/2}\left(l_\alpha - b_\gamma\right)\right] \mid \hat{V}_\gamma, \hat{B}_{\gamma,M}, \hat{\tau}_\gamma\right) + o\left(1\right)\\
=& \mathbb{E}\left[\mathbf{P}\left(-l_\alpha \le n^{-1/2}\hat{V}_\gamma^{1/2}\tilde{Z} + b_\gamma \le l_\alpha\right) \mid \hat{V}_\gamma, \hat{B}_{\gamma,M}, \hat{\tau}_\gamma\right] + o\left(1\right)\\
=& 1 - \alpha + o\left(1\right)
\end{aligned}$$

Robustness to CATE Heterogeneity Misspecification

$$\hat{\tau}_\gamma \pm l_\alpha, l_\alpha = \min\left\{ l : \mathbf{P}\left[\left| b + n^{-\frac{1}{2}} \hat{V}_\gamma^{\frac{1}{2}} \tilde{Z} \right| \le l \right] \ge 1 - \alpha, \forall |b| \le \hat{B}_{\gamma, M} \right\}$$

where

$$\mathcal{T}_M = \left\{ \tau\left(\cdot\right) \mid \tau\left(u\right) = \bar{\tau} + \Delta\left(u\right), \bar{\tau} \in \mathbb{R}, |\Delta\left(u\right)| \le M \right\}, \ M \in [0, 1]$$

Consider an extreme misspecification of CATE heterogeneity: $M = 0$, are the CIs robust?

Robustness to CATE Heterogeneity Misspecification

$$\hat{\tau}_\gamma \pm l_\alpha, l_\alpha = \min\left\{l : \mathbf{P}\left[\left|b + n^{-\frac{1}{2}}\hat{V}_\gamma^{\frac{1}{2}}\tilde{Z}\right| \leq l\right] \geq 1 - \alpha, \forall |b| \leq \hat{B}_{\gamma,M}\right\}$$

where

$$\mathcal{T}_M = \left\{\tau\left(\cdot\right) \mid \tau\left(u\right) = \bar{\tau} + \Delta\left(u\right), \bar{\tau} \in \mathbb{R}, |\Delta\left(u\right)| \leq M\right\}, \ M \in [0,1]$$

Corollary: Robustness to CATE Heterogeneity Misspecification

The CIs under the misspecification of $M = 0$ is still valid, but only for the convenience-weighted treatment effect:

$$\tau_{h,+} := \int \frac{h\left(u, \gamma_+\right)}{\mathbb{E}_G\left[h\left(U, \gamma_+\right)\right]} \tau\left(u\right) \mathrm{d}G\left(u\right)$$

Robustness to CATE Heterogeneity Misspecification

Corollary: Robustness to CATE Heterogeneity Misspecification

The CIs under the misspecification of $M = 0$ is still valid, but only for:

$$\tau_{h,+} := \int \frac{h\left(u, \gamma_+\right)}{\mathbb{E}_G\left[h\left(U, \gamma_+\right)\right]} \tau\left(u\right) \mathrm{d}G\left(u\right)$$

$$a\mathrm{Bias} = \theta_\gamma - \tau_w = \int \left(\frac{h\left(u, \gamma_+\right)}{\mathbb{E}_G\left[h\left(U, \gamma_+\right)\right]} - \frac{h\left(u, \gamma_-\right)}{\mathbb{E}_G\left[h\left(U, \gamma_-\right)\right]} \right) \alpha_{(0)}\left(u\right) \mathrm{d}G\left(u\right)$$
$$+ \underbrace{\int \left(\frac{h\left(u, \gamma_+\right)}{\mathbb{E}_G\left[h\left(U, \gamma_+\right)\right]} - \frac{w\left(u\right)}{\mathbb{E}_G\left[w\left(U\right)\right]} \right) \tau\left(u\right) \mathrm{d}G\left(u\right)}_{\text{CATE heterogeneity bias}}$$

Applications

Design Estimators

The goal: Make the confidence intervals **shorter**

$$\hat{\tau}_\gamma \pm l_\alpha, \qquad l_\alpha = \min\left\{l : \mathbf{P}\left[\left|b + n^{-\frac{1}{2}}\hat{V}_\gamma^{\frac{1}{2}}\tilde{Z}\right| \le l\right] \ge 1 - \alpha, \forall |b| \le \hat{B}_{\gamma,M}\right\}$$

by minimizing the worst-case MSE of

$$\hat{\tau} = \hat{\mu}_{\gamma,+} - \hat{\mu}_{\gamma,-} = \frac{\sum_i \gamma_+(Z_i) Y_i}{\sum_i \gamma_+(Z_i)} - \frac{\sum_i \gamma_-(Z_i) Y_i}{\sum_i \gamma_-(Z_i)}$$

Design Estimators: Quadratic Programming

Solve

$$\min_{\gamma_\pm(\cdot)} \frac{1}{n} \left(\int \gamma_-^2 (z) \, \mathrm{d}\bar{F}(z) + \int \gamma_+^2 (z) \, \mathrm{d}\bar{F}(z) \right) + (t_1 + t_2)^2$$

s.t.

$$|h(u, \gamma_+) - h(u, \gamma_-)| \leq t_1, \qquad \forall u$$

$$M |h(u, \gamma_\diamond) - \bar{w}(u)| \leq t_2, \qquad \forall u, \diamond \in \{\pm\}$$

$$\int \gamma_+ (z) \, \mathrm{d}\bar{F}(z) = \int \gamma_- (z) \, \mathrm{d}\bar{F}(z) = 1$$

$$\gamma_- (z) = 0, \qquad z \geq c$$

$$\gamma_+ (z) = 0, \qquad z < c$$

$$|\gamma_\diamond (z)| \leq C n^\beta, \quad \forall z, \diamond \in \{\pm\}$$

Design Estimators: Quadratic Programming

Solve

$$\frac{1}{k} < \bar{F}\left([c,\infty)\right) < 1 - \frac{1}{k}, \sup_u |\bar{w}\left(u\right)| < k \quad \sup_z \left|\gamma_\diamond^{(n)}\left(z\right)\right| < Cn^\beta \mathbb{E}\left[\gamma_\diamond^{(n)}\left(Z_i\right)\right]$$
$$\Rightarrow \int \gamma_\diamond^{(n)}\left(z\right) \mathrm{d}F\left(z\right) > \delta \qquad \sup_u \left|h\left(u,\gamma_\diamond^{(n)}\right)\right| < C'\mathbb{E}\left[\gamma_\diamond^{(n)}\left(Z_i\right)\right] \Rightarrow$$

Theorem: Asymptotic Normality of $\hat{\tau}$

Suppose the sequence of weighting kernels $\gamma_+^{(n)}$ and $\gamma_-^{(n)}$ is deterministic, and $\exists \beta \in \left(0, \frac{1}{2}\right), C, C' > 0$ s.t. $\forall n$ large enough: $\sup_z \left|\gamma_\diamond^{(n)}\left(z\right)\right| < Cn^\beta \mathbb{E}\left[\gamma_\diamond^{(n)}\left(Z_i\right)\right]$, $\sup_u \left|h\left(u,\gamma_\diamond^{(n)}\right)\right| < C'\mathbb{E}\left[\gamma_\diamond^{(n)}\left(Z_i\right)\right]$ where $\diamond = \{+,-\}$ Then

$$\frac{\sqrt{n}\left(\hat{\tau}_\gamma - \theta_\gamma\right)}{\sqrt{V_\gamma}} \xrightarrow{d} \mathcal{N}\left(0,1\right)$$

Design Estimators: Procedure

- **Input:**
  - samples $\{Z_i, Y_i, W_i\}$ and cutoff c
  - sensitivity model $\mathcal{T}_M$, estimand of interest τ_w
  - nominal significance level α

Design Estimators: Procedure

- **Input:**
  - samples $\{Z_i, Y_i, W_i\}$ and cutoff c
  - sensitivity model $\mathcal{T}_M$, estimand of interest τ_w
  - nominal significance level α

- **Procedure:**
  - S1 guess/estimate $\bar{F}(\cdot)$ and $\bar{w}(\cdot)$ via nonparametric maximum likelihood
  - S2 solve the minimax program, get γ_+, γ_-
  - S3 form the point estimate $\hat{\tau}_\gamma$ and its variance $\hat{V}_\gamma$
  - S4 estimate the worst-case bias
    $\hat{B}_\gamma = \sup\left\{ |\text{Bias}\left[\gamma_\pm, \tau_w; \alpha_0(\cdot), \tau(\cdot), G\right]| : G \in \mathcal{G}_n, \alpha_{(0)}(\cdot) \in [0,1], \tau(\cdot) \in \mathcal{T}_M \right\}$
  - S5 form the bias-aware CIs at level α as
    $\hat{\tau}_\gamma \pm l_\alpha, l_\alpha = \min\left\{ l : \mathbf{P}\left[\left|b + n^{-\frac{1}{2}}\hat{V}_\gamma^{\frac{1}{2}}\tilde{Z}\right| \le l\right] \ge 1 - \alpha, \forall |b| \le \hat{B}_{\gamma, M} \right\}$

Design Estimators: Example
Discussion

Literature: Continuity-Based RD

Most popular: local linear regression (Hahn et al., 2001; G. W. Imbens and Lemieux, 2008)

$$\hat{\tau}_c = \arg\min_{\tau} \left\{ \sum_{i=1}^{n} \underbrace{K}_{\text{weighting}} \left(\frac{|Z_i - c|}{\underbrace{h_n}_{\text{bandwidth}}} \right) \left(Y_i - a - \tau W_i - \beta_- (Z_i - c)_- - \beta_+ (Z_i - c)_+ \right)^2 \right\}$$

Most popular: local linear regression (Hahn et al., 2001; G. W. Imbens and Lemieux, 2008)

$$\hat{\tau}_c = \arg \min_{\tau} \left\{ \sum_{i=1}^{n} \underbrace{K}_{\text{weighting}} \left(\frac{|Z_i - c|}{\underbrace{h_n}_{\text{bandwidth}}} \right) \left(Y_i - a - \tau W_i - \beta_- \left(Z_i - c \right)_- - \beta_+ \left(Z_i - c \right)_+ \right)^2 \right\}$$

Literature: Continuity-Based RD

Most popular: local linear regression (Hahn et al., 2001; G. W. Imbens and Lemieux, 2008)

$$\hat{\tau}_c = \arg \min_{\tau} \left\{ \sum_{i=1}^{n} \underbrace{K}_{\text{weighting}} \left(\frac{|Z_i - c|}{\underbrace{h_n}_{\text{bandwidth}}} \right) \left(Y_i - a - \tau W_i - \beta_- \left(Z_i - c \right)_- - \beta_+ \left(Z_i - c \right)_+ \right)^2 \right\}$$

- $\mu_{(w)}(z) = \mathbb{E}\left[Y(w) \mid Z = z\right]$ is **smooth**
- h_n decays at an **appropriate** rate

Literature: Continuity-Based RD

Most popular: local linear regression (Hahn et al., 2001; G. W. Imbens and Lemieux, 2008)

$$\hat{\tau}_c = \arg\min_{\tau} \left\{ \sum_{i=1}^{n} \underbrace{K}_{\text{weighting}} \left(\frac{|Z_i - c|}{\underbrace{h_n}_{\text{bandwidth}}} \right) \left(Y_i - a - \tau W_i - \beta_- \left(Z_i - c \right)_- - \beta_+ \left(Z_i - c \right)_+ \right)^2 \right\}$$

- $\mu_{(w)}(z) = \mathbb{E}\left[Y(w) \mid Z = z \right]$ is **smooth**
- h_n decays at an **appropriate** rate

Robust CIs (Armstrong and Kolesár, 2020; Calonico et al., 2014; Kolesár and Rothe, 2018);

Literature: Continuity-Based RD

Most popular: local linear regression (Hahn et al., 2001; G. W. Imbens and Lemieux, 2008)

$$\hat{\tau}_c = \arg\min_{\tau} \left\{ \sum_{i=1}^{n} \underbrace{K}_{\text{weighting}} \left(\frac{|Z_i - c|}{\underbrace{h_n}_{\text{bandwidth}}} \right) \left(Y_i - a - \tau W_i - \beta_- (Z_i - c)_- - \beta_+ (Z_i - c)_+ \right)^2 \right\}$$

- $\mu_{(w)}(z) = \mathbb{E}\left[Y(w) \mid Z = z \right]$ is **smooth**
- h_n decays at an **appropriate** rate

Robust CIs (Armstrong and Kolesár, 2020; Calonico et al., 2014; Kolesár and Rothe, 2018); Data-adaptive bandwidths (G. Imbens and Kalyanaraman, 2012)

Literature: Continuity-Based RD extended

$$\mu_{(w)}(z) = \mathbb{E}\left[Y(w) \mid Z = z\right]$$

If further assume **convexity** of $\mu_{(w)}(z)$, e.g.:

$$\left|\mu''_{(w)}(z)\right| \leq B, \forall z \in \mathbb{R}$$

Literature: Continuity-Based RD extended

$$\mu_{(w)}(z) = \mathbb{E}\left[Y(w) \mid Z = z\right]$$

If further assume **convexity** of $\mu_{(w)}(z)$, e.g.:

$$\left|\mu''_{(w)}(z)\right| \leq B, \forall z \in \mathbb{R}$$

Optimization-based RD: the treatment effect τ_c can be estimated (minimax linear estimation) via **numerical convex optimization** (Armstrong and Kolesár, 2018; G. Imbens and Wager, 2019)

Link Noise-Induced RD and Continuity-Based RD

$$\mu_{(w)}(z) = \mathbb{E}\left[Y_i(w) \mid Z_i = z\right]$$
$$= \frac{\int \mathbb{E}\left[Y_i(w) \mid U_i = u, Z_i = z\right] p(z \mid u)\, \mathrm{d}G(u)}{f_G(z)} = \frac{\int \alpha_{(w)}(u)\, p(z \mid u)\mathrm{d}G(u)}{\int p(z \mid u)\mathrm{d}G(u)}$$

Link Noise-Induced RD and Continuity-Based RD

$$\mu_{(w)}(z) = \mathbb{E}\left[Y_i(w) \mid Z_i = z\right]$$

$$= \frac{\int \mathbb{E}\left[Y_i(w) \mid U_i = u, Z_i = z\right] p(z \mid u)\,\mathrm{d}G(u)}{f_G(z)} = \frac{\int \boxed{\alpha_{(w)}(u)}\, p(z \mid u)\mathrm{d}G(u)}{\int p(z \mid u)\mathrm{d}G(u)}$$

Link Noise-Induced RD and Continuity-Based RD

$$\mu_{(w)}(z) = \mathbb{E}\left[Y_i(w) \mid Z_i = z\right]$$

$$= \frac{\int \mathbb{E}\left[Y_i(w) \mid U_i = u, Z_i = z\right] p\left(z \mid u\right) \mathrm{d}G\left(u\right)}{f_G\left(z\right)} = \frac{\int \boxed{\alpha_{(w)}(u)}\, p\left(z \mid u\right) \mathrm{d}G\left(u\right)}{\int p\left(z \mid u\right) \mathrm{d}G\left(u\right)}$$

Convexity assumption on $\mu_{(w)}(z)$:

$$\left|\mu''_{(w)}(z)\right| \leq B, \forall z \in \mathbb{R}$$

Link Noise-Induced RD and Continuity-Based RD

$$\mu_{(w)}(z) = \mathbb{E}\left[Y_i(w) \mid Z_i = z\right]$$

$$= \frac{\int \mathbb{E}\left[Y_i(w) \mid U_i = u, Z_i = z\right] p\left(z \mid u\right) \mathrm{d}G\left(u\right)}{f_G\left(z\right)} = \frac{\int \boxed{\alpha_{(w)}\left(u\right)} p\left(z \mid u\right) \mathrm{d}G\left(u\right)}{\int p\left(z \mid u\right) \mathrm{d}G\left(u\right)}$$

Convexity assumption on $\mu_{(w)}(z)$:

$$\left|\mu_{(w)}''(z)\right| \le B, \forall z \in \mathbb{R}$$

Then the worst-case possible curvature is:

$$\mathrm{Curv}\left(z, \rho, p\right) = \sup\left\{\left|\frac{\mathrm{d}^2\mu_{(w)}\left(z\right)}{\mathrm{d}z^2}\right| : f_G\left(z\right) = \int p\left(z \mid u\right) \mathrm{d}G\left(u\right) \ge \rho > 0, \alpha_{(w)}\left(\cdot\right) \in [0, 1]\right\}$$

Link Noise-Induced RD and Continuity-Based RD

$$\mu_{(w)}(z) = \mathbb{E}\left[Y_i(w) \mid Z_i = z\right]$$

$$= \frac{\int \mathbb{E}\left[Y_i(w) \mid U_i = u, Z_i = z\right] p(z \mid u) \mathrm{d}G(u)}{f_G(z)} = \frac{\int \boxed{\alpha_{(w)}(u)} p(z \mid u) \mathrm{d}G(u)}{\int p(z \mid u) \mathrm{d}G(u)}$$

Then the worst-case possible curvature is:

$$\mathrm{Curv}(z, \rho, p) = \sup\left\{\left|\frac{\mathrm{d}^2 \mu_{(w)}(z)}{\mathrm{d}z^2}\right| : f_G(z) = \int p(z \mid u)\,\mathrm{d}G(u) \geq \rho > 0, \alpha_{(w)}(\cdot) \in [0, 1]\right\}$$

Armstrong and Kolesár (2020): fit 4th-degree polynomials to $\mu_{(0)}(z)$ and $\mu_{(1)}(z)$, and take the largest estimated curvature obtained anywhere

Literature: Randomization Inference RD

Posit a non-trivial interval $\mathcal{I}$ with $c \in \mathcal{I}$ s.t.

$$\{Y_i(0), Y_i(1)\} \perp Z_i \mid \{Z_i \in \mathcal{I}\}$$

then focus on this interval, perform classical **randomized** study inference

Literature: Randomization Inference RD

Posit a non-trivial interval $\mathcal{I}$ with $c \in \mathcal{I}$ s.t.

$$\{Y_i(0), Y_i(1)\} \perp Z_i \mid \{Z_i \in \mathcal{I}\}$$

then focus on this interval, perform classical **randomized** study inference

- Design-based approach (Rubin, 2008)

Literature: Randomization Inference RD

Posit a non-trivial interval $\mathcal{I}$ with $c \in \mathcal{I}$ s.t.

$$\{Y_i(0), Y_i(1)\} \perp Z_i \mid \{Z_i \in \mathcal{I}\}$$

then focus on this interval, perform classical **randomized** study inference

- Design-based approach (Rubin, 2008)
- Strong assumption
  No **data-driven way** of choosing $\mathcal{I}$
  If the interval $\mathcal{I}$ is known a-priori, the problem collapses to a **RCT**

Measurement Error Induced RD

Rokkanen (2015) considers a similar approach, assuming:

Measurement Error Induced RD

Rokkanen (2015) considers a similar approach, assuming:

- noisy running variables **(A2)** and exogeneity of the noise **(A3)**
- **NOT** assuming prior knowledge of the noise distribution $p(\cdot \mid u)$

Measurement Error Induced RD

Rokkanen (2015) considers a similar approach, assuming:

- noisy running variables **(A2)** and exogeneity of the noise **(A3)**
- **NOT** assuming prior knowledge of the noise distribution $p(\cdot \mid u)$
- A stronger assumption: observing at least 3 noisy measurements of the latent variable U_i, $\{Z_i, Z_i', Z_i''\}$

Measurement Error Induced RD

Rokkanen (2015) considers a similar approach, assuming:

- noisy running variables **(A2)** and exogeneity of the noise **(A3)**
- **NOT** assuming prior knowledge of the noise distribution $p(\cdot \mid u)$
- A stronger assumption: observing at least 3 noisy measurements of the latent variable U_i, $\{Z_i, Z_i', Z_i''\}$

Measurement Error Induced RD

Rokkanen (2015) considers a similar approach, assuming:

- noisy running variables **(A2)** and exogeneity of the noise **(A3)**
- **NOT** assuming prior knowledge of the noise distribution $p(\cdot \mid u)$
- A stronger assumption: observing at least 3 noisy measurements of the latent variable U_i, $\{Z_i, Z_i', Z_i''\}$
  - (U_i, Z_i, Z_i', Z_i'') is **joint normal**
  - $\alpha_{(w)}(u) = \mathbb{E}\left[Y_i(w) \mid U_i = u\right]$ is **linear** w.r.t. u

RD with Ordinal Running Variables

Similarly, ordinal Z_i (bond rating, custody security score, etc.) can be seen as a noisy measurement of a latent variable U_i (Li et al., 2021)
Li et al. (2021) assume

$$U_i = \mathbf{X}_i \beta + \epsilon_i$$

then use **inverse-propensity weighting** with estimated propensities
$e(u) = \mathbb{P}\left[Z_i \geq c \mid U_i = u\right]$ for inference.

RD with Ordinal Running Variables

Similarly, ordinal Z_i (bond rating, custody security score, etc.) can be seen as a noisy measurement of a latent variable U_i (Li et al., 2021)
Li et al. (2021) assume

$$U_i = \mathbf{X}_i \beta + \epsilon_i$$

then use **inverse-propensity weighting** with estimated propensities
$e(u) = \mathbb{P}\left[Z_i \geq c \mid U_i = u\right]$ for inference.

Assuming: U_i can be well predicted by observable $\mathbf{X}_i$

Measurement Errors

- The **running variable** is unobserved, only a noisy measurement is observed
  Bartalotti et al. (2021), Davezies and Le Barbanchon (2017), Dong and Kolesár (2021),
  and Pei and Shen (2017)

- Measurement error in causal inference beyond RD
  Jiang and Ding (2020), Kuroki and Pearl (2014), and Pearl (2012)

A Comparison

RD designs	Assumptions
Noise-induced RD	a **known distribution** of the measurement error $p(\cdot \mid u)$
Noise-induced RD (Rokkanen, 2015)	**multiple joint-normal** noisy measurements (U_i, Z_i, Z_i', Z_i'')
	linear $\alpha_{(w)}(u) = \mathbb{E}[Y_i(w) \mid U_i = u]$
Continuity-based RD	$\mu_{(w)} = \mathbb{E}[Y(w) \mid Z = z]$ is **smooth**
OPtimization-based RD	**convexity** of $\mu_{(w)}(z)$: $\left|\mu_{(w)}''(z)\right| \leq B, \forall z \in \mathbb{R}$
Randomization inference RD	an **"RCT"** interval $\mathcal{I}$: $\{Y_i(0), Y_i(1)\} \perp Z_i \mid \{Z_i \in \mathcal{I}\}$
RD with ordinal Z_i	U_i can be observed, and well predicted by $\mathbf{X}_i$

A Comparison

RD designs	Assumptions
Noise-induced RD	a **known distribution** of the measurement error $p(\cdot \mid u)$
Noise-induced RD (Rokkanen, 2015)	**multiple joint-normal** noisy measurements (U_i, Z_i, Z_i', Z_i'')
	linear $\alpha_{(w)}(u) = \mathbb{E}[Y_i(w) \mid U_i = u]$
Continuity-based RD	$\mu_{(w)} = \mathbb{E}[Y(w) \mid Z = z]$ is **smooth**
OPtimization-based RD	**convexity** of $\mu_{(w)}(z)$: $\left|\mu''_{(w)}(z)\right| \leq B, \forall z \in \mathbb{R}$
Randomization inference RD	an **"RCT"** interval $\mathcal{I}$: $\{Y_i(0), Y_i(1)\} \perp Z_i \mid \{Z_i \in \mathcal{I}\}$
RD with ordinal Z_i	U_i can be observed, and well predicted by $\mathbf{X}_i$
